A modern regional hospital completely automated with record

A modern acute hospital with functional solutions, good room allocations and short connecting routes was built on the existing hospital site. The new building enables optimised operational and process flows. These are decisive for the staffing requirements, the future operating costs and the process quality.

In order to ensure high quality medical and nursing services in the future, a new hospital building was necessary. The building fabric and the infrastructure of the hospital (ventilation, water, medical gas and electrical lines) were getting on in years. The building and room structures, which were over forty years old, no longer met today's needs and requirements. In the new building, the operational processes are optimised and adapted to modern medicine and its requirements. In addition, the economic efficiency of the service company will be increased.

Losinger Marazzi was commissioned with the complete planning and implementation of the new building as part of a total contractor contract. This regional hospital with approx. 180 beds was handed over to the hospital management after a construction period of almost 3.5 years. As a partner for door automation, record Türautomation AG was able to advise, design and install all automatic doors. A wide variety of record products were used to provide the best solution for the hospital's operations, both functionally and aesthetically. The service and planning competence of the record employees was appreciated and helped to keep the tight schedule to the day.
